

METHOD, SYSTEM, AND PROGRAM FOR DEFINING
ASSET QUERIES IN A DIGITAL LIBRARY

ABSTRACT

5 Provided are a method, system, and program for defining asset classes in a digital
library. At least one asset class is defined to include at least one attribute and attributes
are defined for each asset class to have an attribute object type. The attribute object type
is defined to indicate one of a plurality of different data structure formats that are
searchable through separate application programs, wherein the attribute object types in
one asset class are implemented in different data structure formats. A asset object
10 instance is generated for each asset class and information is generated in the asset object
instance on a file location of attribute objects providing the attributes for the generated
asset object instance.
